

Andrii L.

Flutter mobile developer

SKILLS

Programming Languages

Flutter/Dart (iOS & Android)

Technical Expertise:

Flutter (iOS, Android, Web, PWA), Clean Architecture, SOLID, State Management (BLoC), Dependency Injection (GetIt, Injectable), Freezed, GoRouter, REST APIs, Dio, WebSockets (Socket.IO), gRPC, Protocol Buffers, Firebase, Supabase, RevenueCat, Push Notifications (FCM, OneSignal), Local Authentication (Biometrics), Flutter Secure Storage, Flutter InAppWebView, Sentry, Crash Reporting, Performance Optimization, Offline-first Applications, Responsive UI, Google Play Console, App Store Connect, Git

Source Control Systems

Git, GitHub, GitLab

Project Management

Scrum, Kanban, Jira, Trello, ClickUp

SUMMARY

Flutter Developer with 5 years of commercial experience developing cross-platform mobile applications with Flutter and Dart. Built and shipped production apps for iOS and Android from MVP to App Store and Google Play release. Experienced in Clean Architecture, BLoC, Firebase, REST APIs, GoRouter, Dio, RevenueCat, push notifications, authentication, and offline-first features. Strong background in application architecture, performance optimization, scalable codebases, and third-party integrations. Experienced in building subscription-based applications, AI-powered features, authentication flows, real-time communication, and Firebase-driven mobile solutions.

Comfortable working independently and taking ownership of the full mobile development lifecycle.

CORE COMPETENCIES:

- Architecture: Scalable Mobile Architecture Clean Architecture SOLID Principles
- Mobile Development: Cross-platform Development Performance Optimization Offline-first Applications Responsive UI
- Backend Integration: REST API Integration Firebase Ecosystem Authentication & Authorization Third-party API & SDK Integration
- Mobile Platform: App Store & Google Play Publishing Push Notifications Deep Linking In-App Purchases
- Leadership: Full Mobile Development Lifecycle Project Ownership Technical Leadership

EXPERIENCE

Flutter Developer, [MakeMebirthday](#)
[App Store](#)
[Google Play](#)

MakeMebirthday is a personal finance and goal-setting application designed to encourage financial discipline through positive reinforcement. The platform combines expense tracking with a unique "micro-goal" system, allowing users to save for short-term rewards - effectively treating themselves to a "birthday" every month or week upon reaching financial milestones.

Technologies

Flutter, Dart, BLoC, Firebase (Auth, Firestore, Cloud Functions, Cloud Messaging, Analytics, Crashlytics), RevenueCat, Flutter Local Notifications, GoRouter.

Requirements

- Development of a cross-platform financial tracking application with a responsive UI for managing daily budgets and savings goals.
- Implementation of a secure authentication system (Google, Apple,

Email/Password) and a 5-step KYC onboarding flow to personalize the user experience.

- Creation of a "Goal Engine" that allows users to set financial targets (with photos and costs) and automatically calculates the daily savings required to achieve them.
- Development of a comprehensive dashboard featuring real-time daily balance calculation, goal progress visualization, and a transaction history log.
- Implementation of an interactive Calendar view for tracking past transactions and completed goals.
- Architecture of a complex, timezone-aware notification system using Firebase Cloud Functions and scheduled triggers to deliver timely reminders (goal completion, transaction logging, daily check-ins) to specific user segments without database overload.
- Integration of RevenueCat to manage subscription tiers, including the implementation of a paywall with a 3-day free trial logic.
- Development of backend maintenance scripts via Cloud Functions for automated user cleanup and data management.

Results

Deployed to both major stores with strict guideline compliance, driving strong user engagement through the successful adoption of the micro-goal methodology.

Engineered a highly scalable, timezone-aware notification architecture capable of delivering precise, scheduled alerts globally, while ensuring a stable, bug-free, and effectively monetized user experience.

Flutter Developer / Project Lead, [Yollly](#)

[App Store](#)

[Google Play](#)

Yollly is an AI-powered culinary companion and meal planning application designed to simplify the daily breakfast routine. The platform features an intelligent AI-driven recipe search, automated weekly meal planners, and collaborative shopping lists, empowering users to seamlessly discover, plan, and prepare healthy meals.

Technologies

Flutter, Dart, BLoC, Auth0, Firebase (Core, Analytics, Crashlytics, Remote Config, Messaging), RevenueCat, Google Mobile Ads, Deepgram STT, Dio, Retrofit, GoRouter, Shared Preferences, Flutter Secure Storage, Slang, Flutter Local Notifications, SSE, Skeletonizer, Flutter Animate.

Requirements

- Architected and developed the entire cross-platform application from scratch as the sole developer, establishing a scalable and maintainable codebase with fully responsive UI/UX support for tablet devices.
- Implemented a secure authentication and verification system utilizing Auth0, supporting Google and Apple Sign-In with server-polling verification mechanisms.
- Designed an open-app navigation strategy using GoRouter, implementing strict authentication guards on protected routes while allowing unauthenticated users to explore basic features.
- Developed an AI-driven culinary module featuring real-time camera UI processing, image compression for backend optimization, and an interactive voice-input mode utilizing Deepgram for advanced speech-to-text transcription.
- Created an advanced Recipe Engine with comprehensive filtering, macro-nutrient calculations, portion scaling, comments, and creator profile views.
- Built a comprehensive Meal Planner and a collaborative Shopping List module supporting user invitations, item cross-referencing, and automatic generation of

ingredient lists from scheduled days.

- Implemented cross-platform monetization using RevenueCat for tiered subscription management and dynamic premium limit dialogs, integrated with Google Mobile Ads as an alternative reward mechanism.
- Integrated a cross-platform notification subsystem combining Firebase Cloud Messaging (FCM) and Flutter Local Notifications, supporting Server-Sent Events (SSE) and complex deep linking for interactive redirects.
- Integrated strict app-version gating via Firebase Remote Config to manage breaking changes and force mandatory updates.

Results

Managed the full mobile lifecycle from architecture to successful deployment on the App Store and Google Play, delivering a responsive, high-performance experience tailored for both smartphones and tablets. Optimized overall app efficiency through intelligent local state-caching and robust Deepgram API integration, while ensuring strict Apple Store compliance via an autonomous on-device content moderation system.

Flutter Developer, Reforge

Reforge is a gamified fitness application that transforms physical training into an immersive RPG-like experience. The platform motivates users to exercise by integrating game mechanics - such as faction wars, character progression, and unlockable lore - into their daily workout routines, fostering a competitive and engaging environment for healthy living.

Technologies

Flutter, Dart, BLoC, Retrofit, Dio, Firebase (Analytics, Crashlytics, Cloud Messaging), RevenueCat, GoRouter.

Requirements

- Development of a feature-rich fitness application combining complex workout logic with gamification elements.
- Implementation of a secure authentication system (Google, Apple, Email/Password) and an interactive onboarding flow for KYC and Faction selection.
- Creation of a dynamic Workout Engine that generates training sessions and sets/reps based on exercise metrics and user progress.
- Development of a sophisticated Reward System that dynamically calculates XP, achievements, and collectible cards based on workout performance.
- Implementation of global and faction-based Leaderboards to drive competition between user groups.
- Integration of a "Lore System" where narrative content is unlocked progressively as the user gains experience.
- Implementation of a robust networking layer using Retrofit and Dio for seamless backend communication.
- Architecture of a scalable navigation system using GoRouter to support deep linking across the application.
- Development of custom high-performance animations, including a unique "Sun Ray" visual effect used throughout the UI.
- Integration of RevenueCat for subscription management and Paywall implementation.

Results

Successfully launched the MVP into active beta testing, establishing a scalable architecture capable of handling complex RPG gamification logic and synchronized backend updates. Delivered a highly dynamic, real-time workout interface and a cross-platform subscription infrastructure, fostering a stable and engaging community-driven fitness ecosystem.

Flutter Developer, [Gamble Count](#)

[App Store](#)

[Google Play](#)

Gamble Count is a supportive mobile application designed to assist individuals in overcoming gambling addiction. The platform offers a comprehensive toolkit for recovery, including sobriety tracking, financial savings monitoring, and stress management exercises, helping users regain control over their habits through daily logging and visual progress tracking.

Technologies:

Flutter, Dart, BLoC, Flutter Flame, Firebase (Auth, Firestore, Analytics, Crashlytics), RevenueCat, fl_chart, Shared Preferences, Flutter Local Notifications, GoRouter.

Requirements:

- Development of a cross-platform mobile application aimed at habit tracking and addiction recovery with offline capabilities.
- Implementation of a secure multi-method authentication system (Google, Apple, Facebook, Email/Password) to ensure user privacy.
- Creation of a dynamic 10-step onboarding and KYC process allowing for both predefined and custom user inputs to personalize the experience.
- Development of a visual dashboard using fl_chart to track key metrics such as sobriety duration (days/hours) and money saved.
- Implementation of a "Stress Relief" module utilizing Flutter Flame to create high-performance interactive mechanics (e.g., "Bubble Wrap" simulation) for immediate tactile distraction during cravings.
- Integration of the Flame GameWidget within the standard Flutter UI hierarchy, ensuring seamless navigation and state management consistency via BLoC between the game loop and the app interface.
- Development of a daily Logbook feature allowing users to record journal entries and rate their emotional state on a 1-5 scale.
- Integration of RevenueCat to manage cross-platform subscriptions and implement a paywall strategy with a 3-day trial period.
- Implementation of a local notification system to encourage daily check-ins and maintain user engagement.

Results:

Successfully launched on the App Store and Google Play, delivering a stable, offline-capable recovery tool to a global user base. Implemented a robust monetization strategy via RevenueCat for trial and subscription management, and leveraged the Flame engine to achieve stable 60 FPS in interactive stress-relief modules, significantly boosting user session times during cravings.
